This area of laminate has been peeled, shot blasted, washed and dried.

Numerous holes and voids can be seen in the laminate.

SAFEGUARD LVP (low viscosity primer) has air release agents in the formula to help displace air that is trapped in the voids during application of the coating. SAFEGUARD LVP will penetrate, consolidate and bond to the laminate and make a solid base for the filler and subsequent coatings. Several coats should be applied, wet on tacky until the laminate has been fully saturated.
